Math 7.2, Period _____

Mr. Rogove

Date: _____

LEARNING OBJECTIVE: We will identify the steps used in solving equations and understand a few steps we CANNOT take when solving equations. (Alg1M1L6)

ACTIVATING PRIOR KNOWLEDGE:

We understand different properties used in math.

	P		_5			0	
Why do the equations $(x - x)$	- 1 <mark>)</mark> ((x+3)	3)	= 17 + x and	(x + 3)	3)	(x-1) = 17 + x have
the same solution set?	0	21/1/	1	TATILIC	D		200

Why do the equations $(x^2 - 1)(x + 3) = 17 + x$ and $x^2 + 2x - 3 = 17 + x$ have the same solution set?

Why do equations (x-1)(x+3) = 17 + x and (x-1)(x+3) + 500 = 517 + x have the same solution set?

why do the equations (x-1)(x+3) = 17 + x and 3(x-1)(x+3) = 51 + 3x have the same solution set? PRO PER TY DF EQUALITY F [MULTIPUCATION]

The state of the s

CONCEPT DEVELOPMENT:

Solving Equations Requires us to make use of the Commutative, Associative and Distributive Properties AS WELL AS use properties of equality to find a solution for a variable.

Example: $x(1-x) + 2x - 4 = 8x - 24 - x^2$

$x - x^2 + 2x - 4 = 8x - 24 - x^2$	Distributive property	
x + 2x - 4 = 8x - 24	Added x^2 to both sides of the equation	PROP. OF EDUALTY
3x - 4 = 8x - 24	Collected like terms	•
3x + 20 = 8x		PROP. OF EDUALTY
20 = 5x	Subtracted $3x$ from both sides of the equation	UBTRACT ION
x = 4	Divided both sides of the equation by 5	P. OFEDUALTY F/DIVISION
		EL DINISION

What is the common solution to all 6 equations listed above? How do we know?

No matter which line we substitute four for,
You will maintain equality. Your equation
will be equal.

Mr. Rogove

Date:

What are some things we need to look out for when applying the rules of equality and rules of arithmetic?

$$\left(\frac{x}{12}\right)^2 = \left(\frac{1}{3}\right)^2$$

- 1. If we do something the left side of the equation, we have to do the same thing to the right side, correct?? What about eliminating both denominators and just saying that x = 1. Why doesn't that work?
- 2. What about squaring both sides of the equation so that $\frac{x^2}{144} = \frac{1}{6}$

Does this change the solution to the equation? YES. X Still equals 4,

but now -4 is also a possible solution.

GUIDED PRACTICE:

Steps for Solving Equations AND Identifying the Steps Taken

- 1. Simplify your equation step by step using properties of equality and properties of arithmetic.
- 2. Identify each step along the way.
- 3. Check your solution by substituting your simplified answer into your original equation.

Solve for *x* and describe the operation used in each step along the way.

$$7x - [4x - 3(x - 1)] = x + 12$$

$$7x - [4x - 3x + 3] = x + 13$$

$$7x - 4x + 3x - 3 = x + 12$$

$$6x - 3 = x + 12$$

$$5x - 3 = 12$$

$$\frac{1}{5}(5x) = (5)\frac{1}{5}$$

$$x = 3$$

7x414x-3x+37 = x+12 DISTRIBUTIVE PROPERTY 7x-4x+3x-3 = x+12 DISTRIBUTIVE PROPERTY 6x-3 = x+12 COMBINE LIKE TERMS 5x-3 = 12 PROP. OF EDUALITY FOR SUBTRACTION 1 (5x)= (5) PROP. OF EDUALITY FOR A DOLTION PROP. OF EDUALITY FOR MULTIPLICA

Mr. Rogove

Date: _____

Solve for *x* and describe the operation used in each step along the way.

$$2[2(3-5x)+4] = 5[2(3-3x)+2]$$

$$2(10-10x) = 5(8-6x)$$

$$20-20x = 40-30x$$
 DISTRIBUTIVE PROP.

$$20 + 10 \times = 40$$

COMBINE LIKE TERMS

PROP. OF EDUALITY FOR A DOITION

PROP. OF EDUALITY FOR SUBTRICTION

PROP. OF EDUALITY FOR DIVISION

Solve for *x* and describe the operation used in each step along the way.

$$\frac{1}{2}(18 - 5x) = \frac{1}{3}(6 - 4x)$$

16}

INDEPENDENT PRACTICE:

- 1. Consider the equations x + 1 = 4 and $(x + 1)^2 = 16$.
- a. Verify that x = 3 is a solution for both equations.
- b. Find a second solution for the second equation.
- c. What effect does squaring both sides of an equation seem to have on the solution set?
- 2. Consider the equation x 3 = 5.
- a. Multiply both sides of the equation by a constant, and show that the solution set did not change.
- b. Now multiply both sides by x. x(x-3) = 5x

Show that x = 8 is still a solution to the equation.

- c. Show that x = 0 is also a solution to the new equation.
- d. Now multiply both sides by the factor (x-1). (x-1)x(x-3) = 5x(x-1)

Show that 8 is still a solution to the new equation.

e. Show that x = 1 is also a solution.
