Mr. Rogove

Date: _____

LEARNING OBJECTIVE: We will solve problems involving fractional markups and markdowns. (G7M1L9)

CONCEPT DEVELOPMENT:

Markdown: The difference between the original sales price, and the discounted sales price is a markdown.

Example: Holiday decorations originally on sale for \$10 are marked down by half now sell for \$5.

Discount: The process of reducing the price of a good to sell more units.

Markup: The difference between the seller's cost for a product and the sales price paid by a customer.

Example: 7-11 buys Doritos at \$0.80 each and marks them up by $\frac{1}{4}$ and sells them \$1.00 each.

Profit: the amount of money that a seller makes for selling a good or service.

Commission: An amount paid to a salesperson for making a sale of an item. This is typically a percentage or fraction of the sale price of the item.

Example: A realtor gets a commission of $\frac{3}{100}$ of the sale price of a home.

Ways to Solve Problems Involving Markups and Markdowns

Example: A pair of shoes originally on sale for \$40 is sold at $\frac{1}{4}$ off of the original price.

1. Tape Diagrams

2. Find the markdown/markup and adjust from original price.

$$40 - \left(\frac{1}{4} \cdot 40\right) = 40 - 10 = \$30$$

ORIG. PRICE - (FRACTION DISCOUNT · ORIG PRICE)

3. Find the fractional part of the price being paid and multiply by the original price.

$$40 \cdot \left(1 - \frac{1}{4}\right) = 40 \cdot \frac{3}{4} = \$30$$

ORIG. PRICE · (1 - FRACTION DISCOUNT)

GUIDED PRACTICE:**Steps for Finding Markups and Markdowns Involving Fractions**

1. Read the problem carefully and decide which method you will use to solve the problem.
2. A tape diagram might be the best if the fraction is easy to break into parts (i.e. $\frac{1}{2}, \frac{1}{3}, \frac{1}{4}$)
3. Find the fractional amount of the markup/markdown and subtract it from the original price.

Mark down

A bicycle shop had a sale where all mountain bikes were $\frac{1}{3}$ off the original price. How much is the sale price of a bike that originally costs \$345?

$$\text{or } 345 - (\frac{1}{3} \cdot 345)$$

$$345 - 115 = \$230$$

$$\text{or } 345 \cdot (1 - \frac{1}{3})$$

$$345 \cdot \frac{2}{3} = \$230$$

Aeropostale is having a sale—all shorts are marked down by $\frac{2}{5}$ from their original price. If shorts are normally sell for \$35, what is the discounted price?

$$35 \div 5 = \$7$$

**Mark up**

Amazon buys a book from a publisher for \$8.00. They then mark it up by $\frac{1}{3}$ and then sell it online to you and me. How much are we charged for the book?

$$\$8 + \$2.67$$

$$\text{or } \boxed{\$10.67}$$

$$8 \cdot (1 + \frac{1}{3}) = 8 \cdot \frac{4}{3} = \$10.67$$

It costs Apple about \$350 to make an iPhone. They mark these costs by $\frac{2}{3}$ and then sell it at their retail stores and online. How much are we paying for a phone?

$$116.67 \times 5 = \$583.35$$

$$350 + 116.67 + 116.67$$

$$350 \times \frac{5}{3} = \$583.34$$

Commission

Janie and John sold a house in Mountain View for \$875,000 and received a commission equal to $\frac{1}{32}$ of the selling price. How much did they earn from selling the house?

$$\frac{1}{32} \times 875,000$$

$$875,000 \div 32$$

\$27,343.75 Commission earned

For every HDTV Wyatt sells, he earns a commission equal to $\frac{1}{8}$ of his total sales.

For the month of December, he sold \$9,400 worth of HDTVs. How much commission did he earn? **WHITEBOARD**

$$9400 \times \frac{1}{8} = \frac{9400}{8}$$

$$= \$1175 \text{ Commission}$$

Mark up then Mark down

A furniture store is having a sale, but before they advertise their sale, they decide to mark up a couch by $\frac{1}{3}$. Then, they sell the couch at a price that is discounted by $\frac{1}{5}$ off of the marked up price. If the original price is \$2,400, how much money will the store make?

$$\underline{\$2400}$$

① $\frac{1}{3}$ mark up
 ② $\frac{1}{5}$ markdown.

$$2400 \div 3 = 800$$

$$2400 + 800 = \underline{\$3200} \text{ (Marked up price)}$$

$$3200 \div 5 = 640$$

$$3200 - 640 = \underline{\$2560} \text{ couch}$$

$$4 \times 640 = \underline{\$2560}$$

Before the holiday season, many stores raise their prices in anticipation of Christmas sales. A 55 inch TV at Best Buy was originally \$1,250. It was first marked up by $\frac{2}{5}$, and then discounted by $\frac{1}{4}$. What was the new price?

X WHITEBOARD X

$$1250 \times \frac{2}{5} = 500$$

$$1250 + 500 = \$1,750 \leftarrow \text{MARKED UP PRICE}$$

$$1750 \div 4 = \underline{437.50}$$

$$437.50 \times 3 = \underline{\$1312.50}$$

Mark down then more Mark down

Abercrombie is having an end of season sale. A pair of jeans that was originally \$45 had been marked down by $\frac{1}{4}$ and then marked down by another $\frac{2}{5}$. What is the new sale price?

$$45 \times \frac{3}{4}$$

$$33.75 \times \frac{3}{5}$$

$$3 \times 11.25 = \$33.75$$

Marked down another $\frac{2}{5}$

$$6.75 \times 3 = \$20.25 \text{ SALE PRICE}$$

Macy's had a sale on sweaters. Sweaters that were \$150 originally were discounted by $\frac{3}{10}$. When I was going to pay, the clerk said I could get an additional $\frac{1}{10}$ off if I opened up a Macy's credit card. I did it. How much money did I save all together?

ON YOUR OWN

$$7 \times 15 = \$105$$

$$105.00$$

$$- 10.50$$

94.50 PAID FOR SWEATER.

$$150.00$$

$$- 94.50$$

\$55.50 saved

Original Price Unknown

Office Depot pays a certain amount for paper clips. They then mark up the price by $\frac{2}{3}$ and sell a box for \$3.50. How much did they originally pay for the paper clips?

$$3.50 \div 5 = .70 \times 3 = \$2.10$$

ORIGINAL PRICE: \$2.10

$$3\frac{1}{2} \div \frac{5}{3}$$

$$\frac{7}{2} \div \frac{5}{3} = \frac{7}{2} \cdot \frac{3}{5} = \frac{21}{10} = \$2.10$$

A motorcycle dealer paid a certain price for a motorcycle and then marked it up by $\frac{1}{5}$ of the price he paid. If he sold the bike for \$14,000, how much was the original price? ON YOUR OWN

$$14000 \div 6 = 2,333.33$$

$$\begin{array}{r} \times \quad 5 \\ 2,333.33 \\ \hline \end{array}$$

\$11,200 would be dividing by 5

INDEPENDENT PRACTICE:

Ashley earns a base salary of \$350, and then makes a commission of $\frac{1}{10}$ of everything she sells. If she sold \$2,200 worth of items last week, how much did she earn in total?

Russell's Furniture store paid a woodworker \$93 for a coffee table and then marked it up $\frac{17}{20}$. How much did they charge for the coffee table?

Paula bought a new pair of glasses. They were originally \$72, but then they were discounted by $\frac{3}{10}$. How much did Paula pay for the glasses?

Daniela is buying kiwi fruit. She pays \$18 for the kiwi fruit. She is really happy because she got a discount of $\frac{2}{10}$. She wants to know how much she actually saved. Help her out.

Caterina is shopping at the mall, and sees a pair of earrings that she is excited about getting. The earrings were originally priced at \$45, but were discounted by $\frac{1}{5}$, and then discounted another $\frac{1}{5}$ from that price because of a one-day sale. What was the price that Caterina paid for the earrings?

Cielo is selling cable knit sweaters. She pays \$27 for the supplies and then marks up the cost by $\frac{2}{3}$. How much did she charge for the sweaters?

Sears pays \$160 for a table saw. They then mark it up by $\frac{3}{4}$. If they discount the marked up price by $\frac{1}{3}$, how much money are they making when they sell a table saw?

Big Fish Games is having a sale on downloads. A game normally priced at \$40 is available at a $\frac{1}{5}$ discount. They are also running a special from 9AM-10AM where they will give customers an additional $\frac{1}{3}$ discount. How much money will you save if you buy between 9AM and 10AM?

NAME: _____

Mr. Rogove

Date: _____

ACTIVATING PRIOR KNOWLEDGE:

We can use tape diagrams to divide and multiply.

Use a tape diagram to determine what $\frac{4}{5}$ of 140 is.	Use a tape diagram to determine what $\frac{1}{6}$ of 132 is.
